Database management system is a software which is used to manage the database. For example: MySQL , Oracle , etc are a very popular commercial database which is used in different applications. DBMS provides an interface to perform various operations like database creation, storing data in it, updating data, creating a table in the database and a lot more.

[DBMS Tutorial | Database Management System - javatpoint](#)

A database management system (DBMS) is a software package designed to define, manipulate, retrieve and manage data in a database. A DBMS generally manipulates the data itself, the data format, field names, record structure and file structure. It also defines rules to validate and manipulate this data. Database management systems are set up on specific data handling concepts, as the practice of administrating a database evolves.

[What is a Database Management System \(DBMS\)? - Definition ...](#)

A database management system (or DBMS) is essentially nothing more than a computerized data-keeping system. Users of the system are given facilities to perform several kinds of operations on such a system for either manipulation of the data in the database or the management of the database structure itself. Database Management Systems (DBMSs) are categorized according to their data structures or types.

[What is a database management system? - IBM](#)

Q1: What is a database management system? A1: An inter related data collection that helps in successful retrieval, insertion and deletion of data from database and organizes the complete data into tables, views, reports etc is known as database. A software that is used to manage all these data in database is known as Database management system.
