The model is written in equation 10:  $s = (m_a - m_b) - \alpha(y_a - y_b) + (\beta - 1/\theta)(i_a - i_b)$  (10) there is a new variable compared to the flexible price monetary model –  $\theta$ . It is the coefficient of adjustment of the present exchange rate to its long term price. The equation is written in a logarithmic form.

We argue that the Campbell-Shiller (4) technique for evaluating present-value models should not be applied to exchange rate models because all researchers acknowledge that some of the important fundamentals - errors in money demand, foreign-exchange risk premiums, the equilibrium real exchange rate - are not observed by the econometrician. The Campbell-Shiller technique implicitly requires that we know and observe all of the relevant fundamentals that determine the asset price.
